Right

Bias Comparison

- Left-Leaning outlets framed the brain implant as an "experimental" tool that "enables" communication, emphasizing the potential for technology to "help" and "empower" individuals, using emotionally charged phrases like "steam thoughts into voice."
- Right-Leaning outlets de-emphasized the experimental nature, focusing instead on the woman speaking for the "first time in 18 years," highlighting individual triumph and innovation while framing the implant as something that "lets" her talk after years of "silence."
- While both sides quoted experts who saw the technology as a "pretty big advance," left-leaning coverage included funding details, while right-leaning coverage de-emphasized this aspect.
- Both sides, however, agreed on the potential of the technology to give voice to those unable to speak, showcasing a shared hope for scientific advancement despite differing framings tied to their core values.

🗨️ He was born with meningitis, had epilepsy and a stroke that does not allow him to speak: “He has an extraordinary ability to relate”

“Hello, I’m Martina and I want to share my story so you can get to know me better. My arrival in the world 10 years ago was all but simple. After being born by natural birth, doctors informed me that I contracted meningitis due to strep B in the birth canal. The odds were against me, but I decided to fight with all

my strength. A stroke confirmed that my life would be marked by significant motor sequelae. However, for my parents, the most import...
